What's New In BRAW Studio?

Supporting the Blackmagic RAW format allows users to benefit from the inherent quality of that native format, but for video files. The new Blackmagic RAW Studio plugin, though, takes the format a step further, and is specifically designed to import Blackmagic RAW files into the Adobe family environment. The workflow is streamlined, and comes with an extensive list of powerful features that come in handy for video editors and producers alike, be they experts in the realm of digital video. The Blackmagic RAW Studio plugin provides support for: Importing RAW files natively, as the Blackmagic RAW format is inherently non-proprietary, and hence supported. Editing RAW files natively, whether with native editing tools or via the powerful user interface of BRAW Studio. Editing non-linear video effects, via the Studio Layer Settings feature. Real-time color grading, via the Studio Layer Settings feature. Real-time video analysis, using the BRAW Studio plugin's playback engine. Batch processing operations, with direct support for both RAW and NLE meta information. Re-encoding video files into any H.264, ProRes, or DNxHD codec. Proxy creation, for both RAW and NLE-formatted files, with support for working with proxy pipelines. Real-time bitrate and frame rate conversion. File monitoring, with a dedicated real-time comparison tool. Live previewing and previewing. Getting a RAW file into the Adobe family environment is quite the undertaking, as it requires an initial import, followed by a conversion to the Adobe codec. The Blackmagic RAW Studio plugin takes care of the conversion step, and comes with a host of features that make the process completely pain-free and highly efficient. For starters, the plugin comes with a user interface, which makes it extremely easy to get up and running, be it that it's as a standalone application, a docked panel within the BRAW Core software, or a plugin for Adobe Media Encoder. The settings interface is configurable, and allows users to fine-tune the output settings for either RAW or NLE-formatted video files, as well as the metadata settings for the file in question. Furthermore, there are a variety of utilities, such as real-time color grading via the Studio Layer Settings, support for proxy pipelines, and general file management features. The Blackmagic RAW Studio plugin is optimized for batch processing operations, and offers direct support for meta information, as well as H.264, ProRes, DNxHD, and Blackmagic RAW. A real-time color grading feature allows users to set-up the exact settings for their video, and even customize the look of the image in real time, based on any one of a number of supported color spaces, in addition to the Studio Layer Settings tool. Additionally
